Abstract

Commentary on the publication of Joos E, Verbeke S, Mehuys E, et al. "Medication administration via enteral feeding tube: a survey of pharmacists' knowledge"(Int J Clin Pharm. 2016;38(1):10-5), that stipulates in the conclusion that pharmacists' knowledge on correct medication administration via EFT (enteral feeding tube) is too limited to be able to provide good advice to EFT patients or their caregivers.

The commentary provides an insight into the point of view of two hospital pharmacists.
